Shockwave Therapy

Shockwave Therapy allows for acoustic waves to trigger biological effects which lead to faster and long-term healing tissue.

This multi-disciplinary device is used in physiotherapy, sports medicine and orthopedics. It is primarily used for fast pain relief and mobility. This non-surgical therapy means the patient has no need for pain killers.

It is ideal therapy to speed up recovery and cure various indicators causing acute or chronic pain.

The acoustic wave carries high energy to painful spots and musculoskeletal tissues with subacute, sub chronic and chronic conditions. It promotes regeneration and reparative processes of the bones, tendons and other soft tissues.

The kinetic energy of the projectile, created by compressed air, is transferred to the transmitter at the end of the applicator to the tissue.
